

Inductors can store energy

Overview

Before looking at how an inductor stores energy, we will need to take a couple steps back and learn a little bit about energy. How does an Inductor "store" energy?

Why is it, then, that an inductor such as simple copper wire loop, can "store" energy in it as an electromagnetic field? Wouldn't the photons or waves of EMF just fly away into space and be lost (the energy would be lost, not stored), how is it that this energy is stored as if the photons would fall back down and hit the wire to create current when the field collapses?

Energy stored in an inductor

Energy stored in an inductor. The energy stored in an inductor is due to the magnetic field created by the current flowing through it. As the current through the inductor changes, the magnetic field also changes, and energy is either stored or released. The energy stored in an inductor can be expressed as: $W = (1/2) * L * I^2$

Energy in a Magnetic Field

Thus, the total magnetic energy, W_m which can be stored by an inductor within its field when an electric current, I flows through it is given as: Energy Stored in an Inductor. $W_m = \frac{1}{2} LI^2$ joules (J). Where, L is the self-inductance of the inductor in henry's, and I is the current in amperes. Note that the factor $\frac{1}{2}$ comes from the integration of the power delivered to the inductor since ...
