

Lithium battery welding overheated and burned

Overview

If the voltage is below 2V, the internal structure of lithium battery will be damaged, and the battery life will be affected. Root cause 1: High self-discharge, which causes low voltage. Solution: Charge the bare lit. Root cause 1: Detecting equipment differences. If the detection accuracy is not enough or the contact resistance cannot be eliminated, it will show that the internal resistance is too. Case 1: Lithium battery expands when charging. When charging lithium battery, it will naturally e. Root cause 1: Incorrect spot welding location. Solution: The correct spot welding position should be at the bottom or marked "A" or "-" side. Unmarked sides and large surface can't be. Root cause 1: Overcharge If the protection circuit or the detection cabinet is out of control, the charging voltage will be greater than 5V, causing the electrolyte decomposition, vi.
