Overview

In all cases considered above, the deviation in transmitting antenna dimension at 5.8-GHz frequency for different beam collection efficiency is provided in Table 1. Here one can rapidly explore that a changed beam efficiency has an immediate effect on the receiving antenna size. For instance in case 1, which is the minimal. The deviation in transmitting antenna dimension at 2.45-GHz frequency for different cases is characterized in Table 2. At this frequency, near to. Up to this point, results are derived for transmitting antenna estimation at 5.8-GHz operating frequency. For this, case 3, lies in the boundary zone, and for a beam efficiency greater than. Now, case 3 is considered for comparison at the selected frequencies for varying beam efficiency. Similarly, a 1-GW unit is a reasonable choice of comparison study for the reason that it is.
