

The role of capacitor lead glue

Overview

In the electronics industry, lead-free products are being adopted and developed in great numbers. Conductive adhesives have gained attention as lead-free products (solder alternative products) that are better for the environment. Our company has commoditized the multilayer ceramic capacitor GCG series for the above-mentioned markets. This series includes external electrodes consisting of Ag (silver) -Pd (palladium) and exhibits reliable adhesive. The conductive filler metal contained in the conductive adhesive and the Ag used in the external electrode carry the risk of insulation properties decreasing if a difference in electric potential occurs in an extremely high-humidity environment. With the conductive adhesive mount, short circuits can occur between electrodes if adhesive leaches out at the lower surface of the part during mounting. Figure 3 (1) and (2) show schematic diagrams of before and after mounting. By combining the broad-ranging temperature characteristics and rated voltage, which are the advantages of our multilayer capacitors, with the above-mentioned Ag external electrode technology, our company provides a reliable product.
