

What are the superconducting energy storage industries

Overview

Superconducting magnetic energy storage (SMES) systems store energy in the magnetic field created by the flow of direct current in a superconducting coil that has been cryogenically cooled to a temperature below its superconducting critical temperature. This use of superconducting coils to store magnetic energy was invented by M. Ferrier in 1970. A typical SMES system consists of four parts: Superconducting magnet and supporting structure. This system includes the superconducting coil, a magnet an. As a consequence of, any loop of wire that generates a changing magnetic field in time, also generates an electric field. This process takes energy out of the wire through the (EMF).
