

## Write out five types of fixed capacitors

### Overview

A capacitor is a two-terminal passive electronic component that stores charge in an electric field between its metal plates. It is made up of two metal plates (electrodes) separated by an insulator known as the dielectric. There are different types of capacitors classified on the basis of their sizes, shapes and materials. Different types of capacitors are given below. There are some of the general applications for all types of capacitors. 1. Smoothing power supply's output. 2. Power factor correction 3. Frequency. There are other miscellaneous types of capacitors which are given below. Integrated Capacitor: They are manufactured inside an IC by metallization and isolation of substrate.
